

Machine Learning for Networks: Introduction -

Andrea Araldo

January 7, 2022

- Artificial intelligence and Machine Learning
- Applications to Communication Networks
- Supervised and Unsupervised Learning
- Data exploration

Section 1

Presentation

AI allows machines to sense, comprehend, act and learn.

...

*AI promises a new era of disruption and productivity, where human **ingenuity** is enhanced by speed and precision*

Accenture [website](#).

A consultant (or a researcher) today.

Common vision of AI

Common vision of AI

Your vision after this course

Common vision of AI

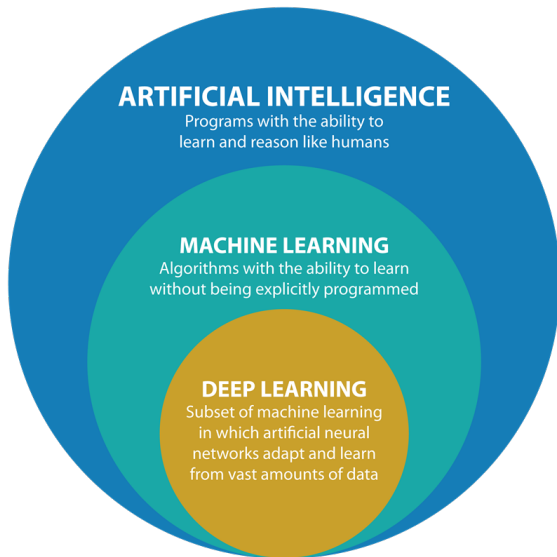

Your vision after this course

- No mysterious “intelligence” or “understanding” in machines
- Machines are still **stupid**.
 - They can only minimize functions.
- Why is AI powerful
 - Smart combination of statistics and optimization
 - Evolution of computing architectures

Blindly trusting Machine “intelligence”:

- Financial loss [Fun20]
 - e.g., Knight Capital loss 440 mln \$ in 45 min due to an algorithm error [SM18].
- Social inequity [Cou18, CDCs19]
 - e.g., racially discriminatory policing [Cou18].
- Deaths [AVC19]
 - Uber car decided not to stop and killed a woman [Li19]

To avoid this: **UNDERSTANDING.**

Sometimes is better to avoid deep learning
(see [Akamai: predicting users' behavior](#))

Definitions

7 / 25

The term “Artificial Intelligence” was coined in the Dartmouth workshop.

Claude Shannon (front right), John McCarthy (back right), Marvin Minsky (center), Ray Solomonoff (front left), and Nathaniel Rochester (back left).

Photo credit Margaret Minsky via www.achievement.org. Description from [R. Guinness](#).

AI: algorithms able to take complex decisions or give complex answers in order to maximize a utility function [[Bri19](#), (1)]:

$$f^* = \arg \max_f \mathbb{E}U(f, e)$$

where:

- f : All possible decisions or answers
- e : Observations of the environment

Machine Learning (ML) [[Bri19](#), §4.1]: “Algorithms . . . that improve their performance with repeated experience on the task”

AI: algorithms able to take complex decisions or give complex answers in order to maximize a utility function [[Bri19](#), (1)]:

$$f^* = \arg \max_f \mathbb{E}U(f, e)$$

where:

- f : All possible decisions or answers
- e : Observations of the environment

Machine Learning (ML) [[Bri19](#), §4.1]: “Algorithms . . . that improve their performance with repeated experience on the task”

ML takes advantage of **big data** to achieve AI.

Theory	Practice
Understand ML methods	
	Use ML Python libraries
	Carry on data science project
Carry on data science project	
Robust interpretation of the results	
	Apply ML to practical network problems

Challenges:

- Networks are extremely complex (many users, protocols, applications, events, ...)
- 5G calls for flexible and adaptive networks (with small human intervention)
- Decisions within milliseconds
- Traffic is encrypted

⇒ The classic “Model and control” approach is infeasible

⇒ Need for **data-driven**, approximated and fast decisions

Opportunities:

- **Big data**: a lot of measures from network equipment
- Nobody dies if the network is inefficient

For your project

- Regression:
 - [Pogemon dataset](#): predict user quality of experience in videos
 - [Encrypted Traffic](#): predict flow duration
- Classification:
 - [Encrypted Traffic](#): predict application
 - [KDD](#): classify attacks
 - Industry 4.0: Defect prediction.
 - You can participate to a [competition of Collège de France](#).
 - Register as student of the course “Apprentissage automatique pour les réseaux”
 - Insert a password (ask me)
- Anomaly detection:
 - [KDD](#): find attacks.
 - Industry 4.0

Other in this course:

- Recommendation system for a video service
- Applications to high speed virtual network functions
- Predictive Maintenance
- Find fraudulent credit card transactions
- Find anomalous traffic from traffic matrices

- One topic per class.
- Groups of 4 students
 - 1 dataset \iff 1 group.
- Cours intégré: theory / practice / your presentation
- Final Project:
 - Each group must show regression, classification, anomaly detection.
 - Collect what you did during the module
- Exam
 - All that has been discussed in class can be asked to the exam, including proofs of theorems.
- Mark:
 - 20% Presence and Participation (questions, presentations, forum)
 - 40% Exam (Theory)
 - 40% Project.

9.239532	0.014076	true	q720p	720

X_{train} **Y_{train}**

X_{test} **Y_{test}**

Parsimony:

- Many parameters \implies Complex Model \implies Overfit

Randomness

- Why: it avoids overfitting.

Symbol type	Notation
Scalar	a
Vector	$\mathbf{a} = \begin{pmatrix} a_1 \\ \vdots \\ a_n \end{pmatrix}$
Vector transpose	$\mathbf{a}^T = (a_1, \dots, a_n)$
Matrix	$\mathbf{U} = \begin{pmatrix} u_{1,1} & \dots & u_{1,n} \\ \vdots & \ddots & \vdots \\ u_{m,1} & \dots & u_{m,n} \end{pmatrix}$
Set	$\mathcal{U} = (\mathbf{u}_1, \mathbf{u}_2, \dots)$

We will try to follow the notation of [[Ger19](#)] (**Available online**).

- Pre-processing
- Data exploration
- Model selection
- Performance evaluation

Section 3

Data exploration

Before performing any supervised or unsupervised learning task, it is better to explore the dataset.

Exercise: Write the definition or the formula of the following quantities (from the notebook) here:

- Mean, Variance, Standard Deviation
- Percentiles, Median
- Boxplot
(Write just what are the lines that compose and how you can compute them)
- Histogram
- Covariance
- Pearson's correlation coefficient

Note: The formulas of the quantities above may be asked at the exam.

Go to notebook 01.exploration
